Cruise Report  
R/V "Oceania", AREX 2007

Ship: R/V "Oceania"

Cruise: AREX 2007

Dates: 19.06.2007 – 05.08.2007

Port Calls: Gdansk (Poland) – Longyearbyen (Spitsbergen)

Number of Scientist: 14

Chief Scientist: dr Waldemar Walczowski

Principal Project: DAMOCLES – WP3

Research Area: Greenland Sea

## **Damocles - WP3. Oceans: Task 3.1 Input Function, Task 3.2 Shelf/Basin Exchange**

Jan Piechura, Waldemar Walczowski, Jaromir Jakacki, Robert Osiński, Piotr Wieczorek, Ilona Goszczko, Małgorzata Kitowska (IO PAS).

### **1. Observations in 2007**

AREX 2007 cruise of the R/V Oceania was performed in the period of June 19 2007 – August 05 2007. CTD (conductivity, temperature, depth) profiles along 11 sections were done (Fig.1, Tab. 1). As in previous years sections were perpendicular to the general direction of the Atlantic Water flow. The AW domain in the Greenland Sea is situated between the Barents Sea slope and system of underwater ridges: Mohns Ridge and Knipovich Ridge. Through convergence of the isobaths in the northern part, AW domain forms a wedge, wide in the southern part and narrower in the northern end. Complicated bottom topography significantly influences the currents pattern and structure. Coverage in the southern part of the investigated area is spare in comparison to the northern one. This causes less accurate horizontal distribution of properties in the region south of the Bear Island. As before, our main effort was concentrated in the northern part of the Atlantic Domain where processes controlling the AW inflow into Arctic Ocean through the Fram Strait and the westward recirculation occur.

For CTD measurements the Seabird SBI9/11plus probe was used. The probe was serviced before the cruise. Temperature and conductivity sensors were calibrated by the Sea-Bird Electronics service. Water samples collected by means of the rosette water sampler SBE32 were analysed at IOPAS laboratory with the Guildline Autosal 8400A.

Currents measurements by means of the lowered Acoustic Doppler Current Profiler (LADCP) were performed at the CTD stations. The self-recording 300 kHz RDI device was used to profile entire water column during the standard CTD casts.

During the whole cruise sustained currents measurements by the ship-mounted ADCP, RDI 150 kHz were performed.

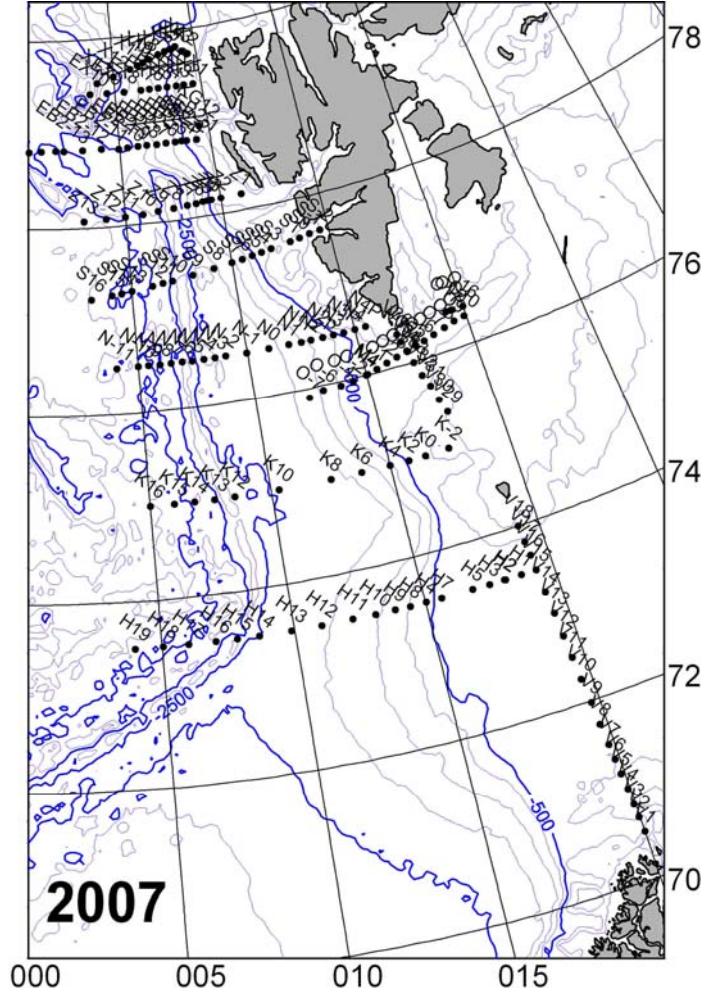

Figure 1: Measurements performed during Arex 2007 experiment.

## 2. Some preliminary results

As formerly, 2007 cruise results acknowledged that there are two branches of Atlantic Water in the Greenland Sea which flow northward. First, main branch of the West Spitsbergen Current flows along the Barents Sea continental slope and Spitsbergen shelf break. Second, colder and less saline branch continues along the Mohns and Knipovich Ridges as a jet stream of the Arctic Front. The force which is responsible for convergence of both branches of AW west of the Spitsbergen coast is bottom topography. Moreover, merely a part of northward running AW moves into the Arctic Ocean, primarily along the Spitsbergen slope; western branch of AW mostly recirculates westward as Return Atlantic Current.

AW enters into the Greenland Sea as a wide flow of warm and more saline water separated from the Norwegian coast by the less saline Norwegian Coastal Current. Due west, the Arctic Front located over the Mohns Ridge separates AW from colder and less saline Arctic Waters. Appreciable part of AW flowing along the Norwegian coast continues eastward into the Barents Sea, the rest goes on northward as two divided arms. One of them is related to the Barents Sea slope. Jet streams of the Arctic Front form the second arm of AW. Salinity and temperature of the eastern and western branch are considerably different; AW carried by the eastern flow is much warmer and more saline than the western one. Distance between the branches in the southern part of WSC is about 150 km and in the northern part - only 30 km. In central and northern part of the WSC recirculation of AW

occurs. Only part of AW, which flows along the shelf break, continues northward through the Fram Strait into the Arctic Ocean.

Measurements at all sections of the area between northern Norway and the Fram Strait performed in summer 2007 show decrease of the AW temperature and salinity. In 2006 the extreme high temperatures of the West Spitsbergen Current core were observed and lower temperatures of the West Spitsbergen Current in 2007 was not so surprising. Also, the extreme northward extension of the warm Atlantic Water was observed in 2006 (Fig 5a). In 2007 the 5° isotherm at 100 dbar moved back to its position from 2005 (Fig 5b).

In summer 2007 Atlantic Water was colder than in 2006 (Fig 5, 6). For example at section N (Fig 3 and Fig 6) mean temperature and salinity at 200 dbar was in 2006 respectively 4.50°C and 35.13, whereas in 2007 it has dropped to 3.84°C and 35.11. However, at this level temperature value was still 0.69°C higher than 1996-2007 mean, and both temperature and salinity trends for this period are positive.

Fig. 7 presents the distribution of baroclinic currents kinetic energy and baroclinic currents at 100 dbar (calculated for the reference level of 1000 m) in summer 2007. Intensive inflow into the Greenland Sea over the Mohn Ridge and division of this inflow is well visible.

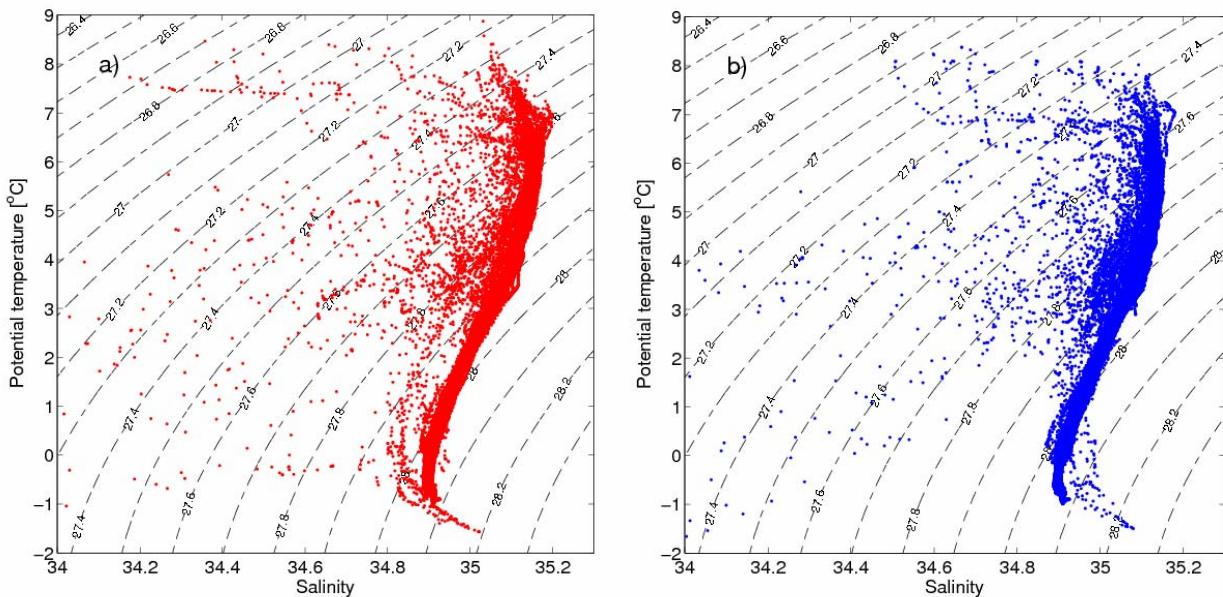

Fig. 2. T-S diagram for all stations: a) in summer 2006 and b) in summer 2007.

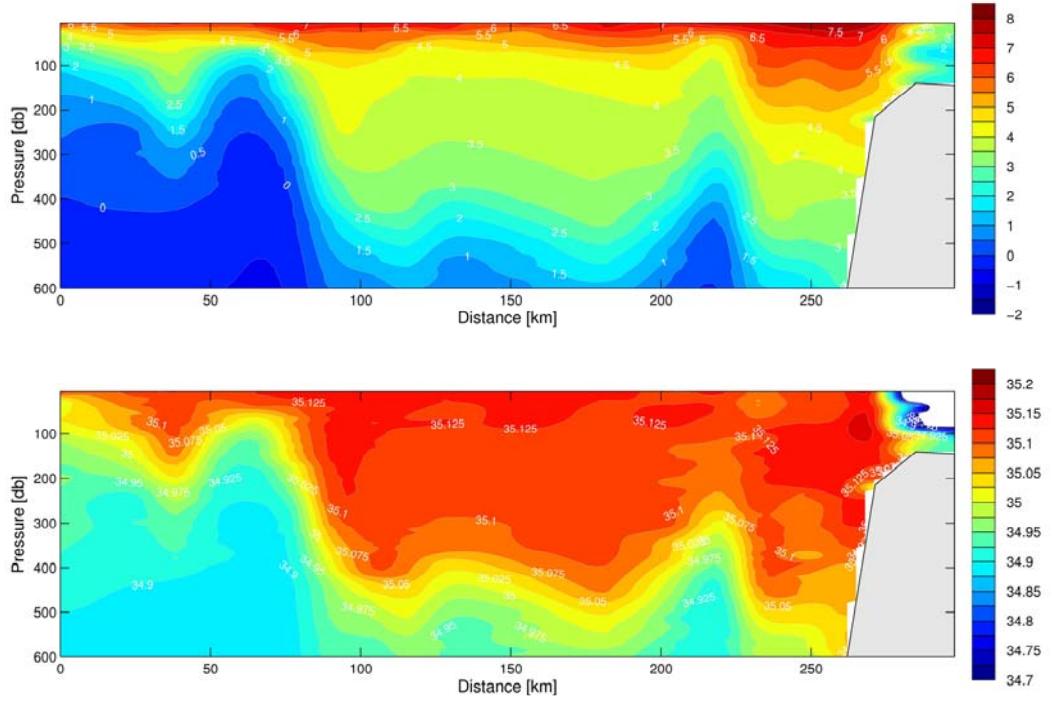

Fig. 3. Potential temperature (upper panel) and salinity in summer 2007 at section ‘N’ ( $76^{\circ}30'$  N).

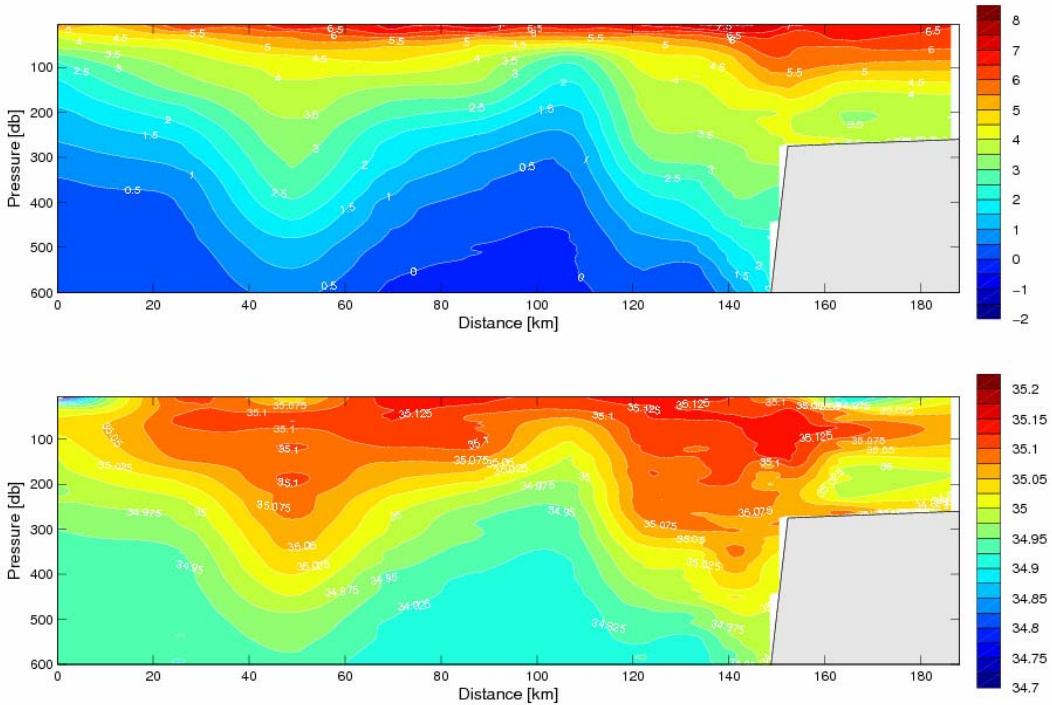

Fig. 4. Potential temperature (upper panel) and salinity in summer 2007 at section ‘Z’ ( $\sim 78^{\circ}$  N).

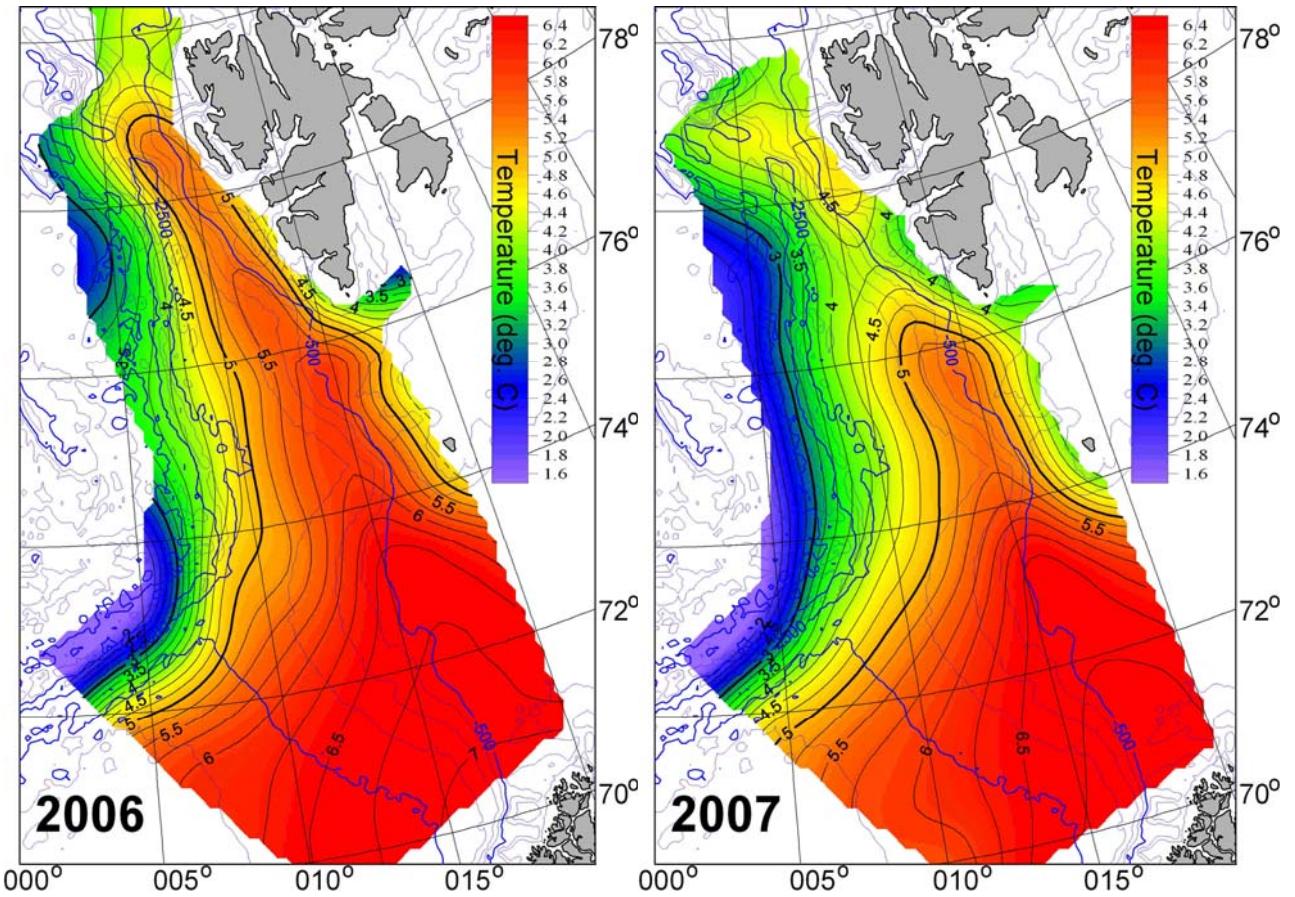

Fig. 5. Temperature at 100 dbar in June-July 2006 (left hand side) and 2007.

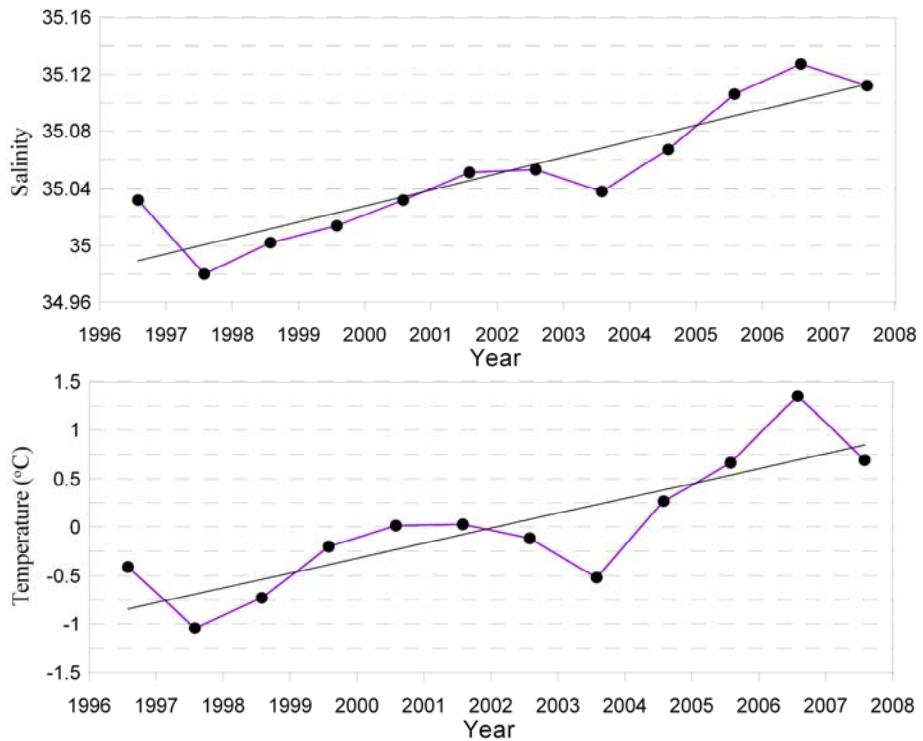

Fig. 6. Mean salinity (upper panel) and mean temperature in summer (July) at section 'N' ( $76^{\circ}30' \text{ N}$ ) at 200 m, between  $009^{\circ}$ - $012^{\circ}$  E.

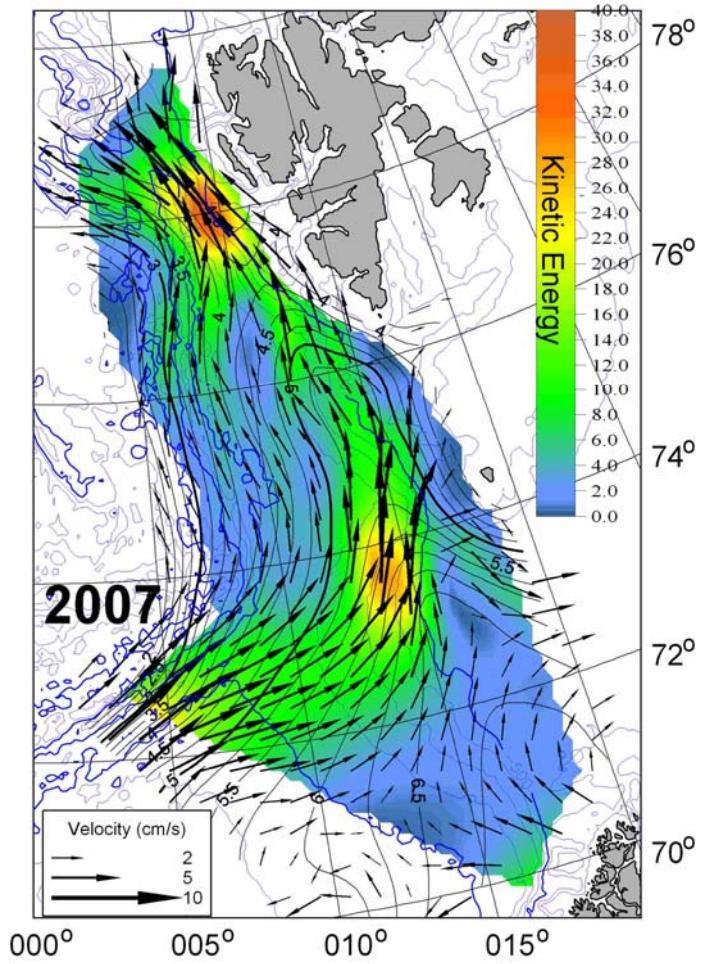

Fig. 7. June-July 2007. Baroclinic flow kinetic energy distribution (colour scale), and baroclinic currents at 100 dbar. Reference level 1000 m.

*Table 1: CTD stations and some of their main parameters. There were 11 regular sections performed in 2007.*
